

Operational Plan: Project Cernarus

Technical Remediation

1. Situation Analysis

Current Status: Critical Technical Failure

Target: 10/10 Technical & SEO Health

The "Cernarus" digital asset is currently failing to meet its core promise of "defensible utility" due to four critical weaknesses identified in the research:

1. **Domain Fracture:** The `.co` TLD is dead, causing traffic leakage.
2. **Semantic Flatness:** The HTML structure lacks depth (no H3-H6), making the content invisible to search crawlers.
3. **Identity Crisis:** The site has no structured data (Schema.org), confusing AI agents between "Cernarus" (the calculator site) and "Chernarus" (the zombie video game).
4. **Ghost Content:** The index is polluted with unrelated data ("Nevada Dept of Education"), likely due to a template failure.

2. Operational Logic & Resource Allocation

- **Human Operator:** Lead Developer & Sysadmin.
- **AI System 1 (Code Assistant - e.g., GitHub Copilot/Claude Dev):** For refactoring HTML templates and writing redirects.
- **AI System 2 (SEO Specialist - e.g., ChatGPT/Perplexity):** For generating JSON-LD Schema and meta tags.
- **AI System 3 (Data Cleaner - e.g., Code Interpreter):** For auditing the sitemap and identifying ghost content.

3. Phase 1: Infrastructure & Domain Triage (The "Bleeding" Fix)

Objective: Restore access and unify the brand domains immediately.

Step 1.1: Fix the TLD Fracture (`.co` -> `.com`)

- **Context:** `cernarus.co` is inaccessible. This destroys trust.
- **Action:** Configure a wildcard 301 Redirect at the DNS/Edge level.
- **Human Task:** Log into your DNS provider (Cloudflare/Vercel/AWS).

PROMPT for AI System 1 (Code):

"Write a Vercel [next.config.js](#) redirect rule (or an Nginx configuration snippet) that permanently redirects all traffic from [cernarus.co/*](#) to [cernarus.com/*](#). Ensure it preserves the path and query parameters (e.g., [cernarus.co/finance/tax](#) -> [cernarus.com/finance/tax](#))."

Step 1.2: Purge "Ghost" Content

- **Context:** The research found "Nevada Department of Education" pages in your sitemap. This is a template artifact.
- **Action:** Locate and delete these routes.

PROMPT for AI System 3 (Data Cleaner):

"I have a list of URLs from my sitemap. Identify any URL that follows the pattern of 'education', 'nevada', 'scholarship', or 'students'. Output a clean list of paths that need to be deleted from the CMS or codebase.

"

4. Phase 2: The Semantic Refactor (The "Visibility" Fix)

Objective: Move from a "flat" H2 structure to a deep, rankable hierarchy.

Step 2.1: Redefine the Heading Map

- **Context:** Currently, "Income Tax Calculator" is just a link. It needs to be an entity.
- **Action:** Update the Next.js page template for category pages.

PROMPT for AI System 1 (Code):

"Refactor this React/Next.js component. Currently, it renders a list of tools using [div](#) tags. Change the structure so that:

1. The Category Title is an [<h2>](#).
2. Each Sub-cluster (e.g., 'Taxes') is an [<h3>](#).
3. Each individual tool card title (e.g., 'Income Tax Calculator') is an [<h4>](#).
Ensure accessibility attributes (aria-labelledby) are included."

Step 2.2: Contextualize "Programmatic" Pages

- **Context:** You have 370 unit converters. They are likely thin content.
- **Action:** Inject unique, technical descriptions for the top 20 pages.

PROMPT for AI System 2 (SEO):

"Write a 50-word technical intro for a 'Rankine to Fahrenheit' converter page. It must mention thermodynamic engineering applications. Do not use fluff. Then, write

a similar intro for 'Nautical Miles to Kilometers' mentioning maritime navigation standards."

5. Phase 3: AI-Optimization & Schema Injection (The "Identity" Fix)

Objective: Disambiguate from the video game and feed data to LLMs.

Step 3.1: Generate Global Organization Schema

- **Context:** Google thinks you are a typo of "Chernarus" (DayZ). You must correct this.
- **Action:** Add **Organization** schema to the `_app.js` or `layout.tsx`.

PROMPT for AI System 2 (SEO):

"Generate a JSON-LD Organization schema for 'Cernarus'.

Key attributes:

- url: '<https://cernarus.com>'
- sameAs: [Link to LinkedIn, Crunchbase]
- description: 'A provider of engineering standards and financial calculation tools.'
- **CRITICAL:** Add a 'disambiguatingDescription' that explicitly states: 'Cernarus is a technical utility platform and is unrelated to the fictional country Chernarus from the ARMA/DayZ video games.'"

Step 3.2: Generate "SoftwareApplication" Schema for Calculators

- **Context:** Make your calculators understandable to AI agents.
- **Action:** Create a dynamic schema generator for your calculator pages.

PROMPT for AI System 1 (Code):

"Create a TypeScript function `generateCalculatorSchema(toolName, description, category)` that returns a valid JSON-LD object of type `SoftwareApplication`. Include fields for 'applicationCategory', 'operatingSystem' (Web), and 'offers' (Free)."

6. Execution Sequence Summary

Sequence	Action	AI System	Output

1	Redirect.co	AI 1	next.config.js redirect rules deployed.
2	Purge Ghosts	AI 3	List of "Nevada" URLs to delete.
3	Refactor HTML	AI 1	New component code with H2/H3/H4 hierarchy.
4	Inject Schema	AI 2	JSON-LD blocks for Org and Tools.
5	Deploy & Verify	Human	Push to production; verify cernarus.co redirects.

Final Success Check:

1. Visit [cernarus.co](#) -> Redirects to [cernarus.com](#).
2. Inspect Element on "Income Tax Calculator" -> Shows `<h4>`.
3. Google Structured Data Test -> Shows valid [SoftwareApplication](#) and [Organization](#) schema.
